

Economic Growth

ECO 120: Global Macroeconomics

Economic Growth

ECO 120: Global Macroeconomics

Goals

2 / 17

- Specific goals:
 - Appreciate the significance for economic growth.
 - Compare patterns of economic growth across countries.
 - Learn what factors affect economic growth.
- Learning objectives:
 - LO5: Compare and explain international differences in macroeconomic outcomes of production, prices, inflation, and employment.
 - LO11: Describe factors that may influence economic growth and use these to explain international difference in growth and development.*

Goals

2 / 17

- Specific goals:

 - LO11: Describe factors that may influence economic growth and use these to explain international difference in growth and development.*

Reading

3 / 17

- Sources for economic growth: Module 17
- Productivity curve: Module 18

U.S. Trend

4 / 17

Long-Term Real GDP Growth

5 / 17

- Before the great depression, average growth rate was 1.4%
- After the great depression, average growth rate was 2.1%
- Real GDP per person in 1900 was approximately \$6,000 (using base year 2009)
- Real GDP per person in 2013 was approximately \$49,800 (base year 2009)
- Can you compute what GDP would be in 2013 if the average growth rate was always 1.4%?
 - Answer: $6000(1 + 0.014)^{113} = \$28,869.56$.
- What if the average growth rate was always 2.1%?
 - Answer: $6000(1 + 0.022)^{113} = \$62,814.53$.
- **Small differences in growth adds up to a lot!**

Long-Term Real GDP Growth

What happens in other developed countries?

6 / 17

(a) Catch-up?

Rich countries, but low rates of growth $\approx 2\%$

After WW2, Japan was lesser-developed, but had a high growth rate

Now Japan is rich and has a low growth rate

Developing Economies in Asia are catching up

7 / 17

Growth rates since 1990:

- Hong Kong $\approx 3\%$
- Singapore $\approx 5\%$
- Taiwan $\approx 5\%$
- Korea $\approx 5\%$
- China $\approx 10\%$

Some Lesser Developed Economies Not Catching Up 8 / 17

(b) No catch-up?

Need Proper Incentives

9 / 17

- Saving and investment in new capital
 - Savings is important for a sufficient equilibrium level of investment.
 - What happens if savings supply is low?
 - Higher levels of capital allows for higher levels of production.
 - and a higher marginal product of labor.
- Investment in human capital
 - Improved education increases the marginal product of labor.
 - Accumulation of knowledge has increasing returns.
- Discovery of new technologies
 - Technological progress drives economic growth in the long run.
 - There needs to be incentives to do research and development.

Preconditions for these incentives

10 / 17

- Markets
 - Enable buyers and sellers to meet.
 - Convey information through price.
- Property rights
 - Creates a profit incentive.
 - Intellectual property rights gives incentive for research and development
- Monetary exchange
 - Facilitates exchange.
 - Eliminates need for a “double coincidence of wants”.

Labor productivity Curve

11 / 17

- **Labor productivity curve:** long-run economic growth model that illustrates how much output per person a country can enjoy with given levels of capital per person.
- Labor productivity is real GDP per hour of labor.

$$\text{Labor productivity} = \frac{\text{Real GDP}}{\text{Aggregate labor hours}}$$

Labor productivity Curve

11 / 17

- **Labor productivity curve:** long-run economic growth model that illustrates how much output per person a country can enjoy with given levels of capital per person.
- Labor productivity is real GDP per hour of labor.

$$\text{Labor productivity} = \frac{\text{Real GDP}}{\text{Aggregate labor hours}}$$

Labor productivity curve

12 / 17

- Think of labor productivity curve as a production function, in per-capita terms.
- Real GDP per unit of labor increases as you increase the amount of capital.
- But at a decreasing rate. Due to *diminishing marginal product of capital*.

Labor productivity curve

12 / 17

- Think of labor productivity curve as a production function, in per-capita terms.
- Real GDP per unit of labor increases as you increase the amount of capital.
- But at a decreasing rate. Due to *diminishing marginal product of capital*.

Labor productivity curve

12 / 17

- Think of labor productivity curve as a production function, in per-capita terms.
- Real GDP per unit of labor increases as you increase the amount of capital.
- But at a decreasing rate. Due to *diminishing marginal product of capital*.

How labor productivity grows

13 / 17

Labor productivity curve

14 / 17

- For given levels of capital stock per worker, curve shows output per worker.
- Increases in capital correspond to *movements* along the curve.
- Increases in technology or human capital *shift* the curve.

Labor productivity curve

14 / 17

- For given levels of capital stock per worker, curve shows output per worker.
- Increases in capital correspond to *movements* along the curve.
- Increases in technology or human capital *shift* the curve.

Labor productivity curve

14 / 17

- For given levels of capital stock per worker, curve shows output per worker.
- Increases in capital correspond to *movements* along the curve.
- Increases in technology or human capital *shift* the curve.

Catch-Up Theory

15 / 17

- Diminishing returns explains catch-up theory.
 - Lesser-developed countries have low levels of capital → high return to investing in new capital.
 - Developed countries (like the U.S.) have high levels of capital → low return to investing in new capital.
- Not all countries catch up. Preconditions for growth do not exist.
 - Poorly developed goods and services markets, financial markets.
 - Corruption and war threaten property rights.
 - Inflation out of control.

How to achieve faster growth

16 / 17

- Stimulate savings. How?
 - Tax incentives: IRA accounts. Tax on consumption.
 - Tax on capital gains reduces savings incentive.
- Stimulate research and development.
 - Patents, research grants.
- Encourage international trade.
 - Fastest growing nations today are those with the fastest growing imports and exports.
 - Achieve gains from trade.
 - Invites foreign direct investment: global businesses create operations in new countries, invest in capital.
- Improve the quality of education.

Growth is not the goal

17 / 17

- What is one (stupid) way to achieve a really high level of economic growth?
 - Increase saving to 100%
 - This would lead to high levels of investment and high levels of growth.
 - But we wouldn't consume anything. That's no fun.
- Goal: Maximize the sustainable level of consumption.
