

# Supply and Demand for Assets

Economics 301: Money and Banking

## 1

### 1.1 Goals

#### Learning Outcomes

- LO3: Predict changes in interest rates using fundamental economic theories including present value calculations, behavior towards risk, and supply and demand models of money and bond markets.
- LO4: Describe how interest rates, interest rate risk, and expectations of future interest rates affect decisions made by consumers and financial institutions.

### 1.2 Reading

#### Reading

- Read Hubbard and O'Brien, Chapter 4.

## 2 Demand for Bonds

### 2.1 Demand Curve

#### Price versus Interest Rate

Yield to maturity,  $i$ , on a discount bond, face value,  $F$ , maturity date,  $T$ , and price,  $P$ :

$$P = \frac{F}{(1+i)^T}$$

$$(1+i)^T = \frac{F}{P}$$

$$1+i = \left(\frac{F}{P}\right)^{1/T}$$

Interest rate is inversely proportional to the price of the bond.

## Demand Curve for Bonds

- Interest rate decrease  $\equiv$  Bond price increase
- $\rightarrow$  **lower return on lending (buying bonds)**
- $\rightarrow$  **decrease in quantity bonds demanded**
- Law of demand for bonds implies the demand curve will be downward sloping.

## 2.2 Determinants of Demand

### Determinants of Asset Demand

- When something *besides the price of the bond* affects the demand for bonds, we say there is a **change in demand** or a **shift in demand**
- Wealth: total value of all resources owned by an individual, including all assets.
  - An increase in wealth shifts the demand for bonds to the right.
- Expected return: changes in expectations of returns for given asset *and related assets*.
- Risk: degree of uncertainty regarding the return of an asset (includes interest and capital gains).
- Liquidity: ease and speed to which an asset can be converted to a means of payment.
  - An increase in liquidity causes an increase in demand for an asset.

## Expected Return

- Expected return: weighted average of all possible cash flows for an asset.
- Example: Suppose a one-year discount bond with face value equal to \$150 is sold for \$120
- ... and there is a 15% chance of full default

$$\text{YTM (No default): } P = \frac{F}{1+i}, \quad 1+i = \frac{F}{P} \quad i = \frac{F}{P} - 1$$

- Return if default  $\equiv R_d = 0$
- Return if no default  $\equiv R = 150/120 - 1 = 0.25$
- Expected return  $\equiv R^e = 0.15(0) + 0.85(0.25) = 0.2125$ .
- An increase in expected return relative to other assets increases demand for the asset today.
- An increase in expected return for alternative assets decreases demand for the asset today.

## Expected Return

- Previous example assumed asset was held through maturity date, so rate of return = yield to maturity.
- Suppose you expect interest rates to rise.
  - What do you expect will happen to the price of the bond?
  - What do you expect will happen to capital gains on the bond?
  - What does effect does this expectation have on *today's* demand for the bond?
- Expected Return should consider *real* return, not *nominal return*.
  - What would happen to the demand for a bond if there is an increase in expected inflation?

## Risk

- **Risk averse:** a lender/saver is risk averse if he/she is willing to accept a lower expected return for an asset that has greater *certainty* for the rate of return.
- **Risk neutral:** a lender/saver is risk averse if uncertainty regarding a return *does not affect* the demand for an asset. Only expected return is considered important.

- **Risk loving:** a lender/saver is risk loving if he/she is willing to accept a lower expected return for an asset that has greater *uncertainty* for the rate of return.
- Assuming risk averse lenders/savers, an increase in the risk of an asset causes a decrease in the demand for the asset.

### 3 Supply for Bonds

#### 3.1 Supply Curve

##### Supply Curve for Bonds

- Interest rate decrease  $\equiv$  Bond price increase
- $\rightarrow$  **lower cost of borrowing (selling bonds)**
- $\rightarrow$  **increase in quantity bonds supplied**
- Law of demand for supply implies the supply curve will be upward sloping.

#### 3.2 Determinants of Supply

##### Determinants of Supply

- When something *besides the price of the bond* affects the supply for bonds, we say there is a **change in supply** or a **shift in supply**.
- An increase in expected profitability of investment opportunities increases the supply of bonds.
  - A recession decreases the profitability of businesses, causes a decrease in supply of bonds.

- Expected inflation: an increase in inflation decreases the real purchasing power of the cash flow.
  - An increase in expected inflation causes an increase in the supply of bonds.
- Government budget: when Federal government runs a budget deficit, they sell government bonds, increasing the supply of bonds.

## 4 Equilibrium

### Equilibrium

- Equilibrium quantity and price (and therefore interest rate) are determined by intersection of supply and demand curves.
- Predict how quantity of bonds, price of bonds, and interest rates will change if...
  - the Federal Reserve sells reserves of Treasury bills on the open market.
  - there is a break down in financial markets that makes it more difficult to buy and sell bonds on the secondary market.
  - businesses expect the an improving economy will result in higher demand for goods and services.
  - people expect the Federal Reserve will soon be raising interest rates.
