

BUS 735: Business Decision Making and Research

Instructor: Dr. James Murray

Fall 2011

Worksheet: Regression Analysis

Learning Objectives:

- LO2: Be able to construct and use multiple regression models (including some limited dependent variable models) to construct and test hypotheses considering complex relationships among multiple variables.
- LO6: Be able to use standard computer packages such as SPSS and Excel to conduct the quantitative analyses described in the learning objectives above.
- LO7: Have a sound familiarity of various statistical and quantitative methods in order to be able to approach a business decision problem and be able to select appropriate methods to answer the question.

Directions: Work in groups of up to four people and answer the following questions. All papers will be collected, but only one member's paper will be randomly selected and graded and all members of the group will receive the same grade.

By signing below, you agree that the following work represents the efforts of everyone in the group, and you are willing to accept as your own grade for the group project the grade earned from this representation of your group's work. Every member must agree to these terms to earn a non-zero grade for this assignment.

_____ Signature Group Member 1	_____ Print Name	_____ Date
_____ Signature Group Member 2	_____ Print Name	_____ Date
_____ Signature Group Member 3	_____ Print Name	_____ Date
_____ Signature Group Member 4	_____ Print Name	_____ Date

The dataset *house.sav* data on 239 recently sold houses including the selling price (in thousands of dollars), the size of the house (in square feet), the number of bedrooms, whether or not the house is on a corner lot (1=corner lot, 0=otherwise) and the age of the house in years. Develop a regression model that can help potential home sellers figure out how much they might get for their house based on the other variables in the dataset.

1. Estimate the regression equation and write down the estimated equation.
2. What is your prediction for the average selling price of a house that is on a corner lot, has 3 bedrooms, is 2412 square feet, and is 18 years old?
3. What percentage of the variability in selling price is explained by your explanatory variables?
