Economic Growth

ECO 120: Global Macroeconomics

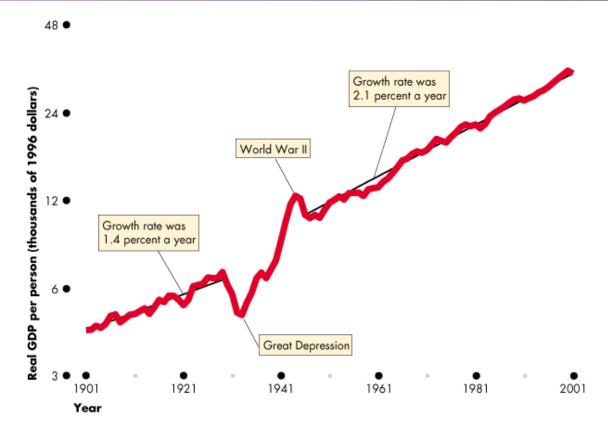

Goals

- Specific goals:
 - Appreciate the significance for economic growth.
 - Compare patterns of economic growth across countries.
 - Learn what factors affect economic growth.
- Learning objectives:
 - LO5: Compare and explain international differences in macroeconomic outcomes of production, prices, inflation, and employment.
 - LO11: Describe factors that may influence economic growth and use these to explain international difference in growth and development.*

Reading and Exercises

- Chapter 10 pp. 246-248: Differences in international growth rates
- Chapter 10 pp. 257-262: Productivity curve model
- Chapter 10 pp. 263-265: Government policies that can promote economic growth
- Canvas Quiz due Wednesday 11:59 PM.
 Multiple-choice, 15 questions, unlimited attempts allowed, only best score counts
- Homework/In-class Exercise due Friday 11:59 PM. We will work together in class on Thursday.

U.S. Trend

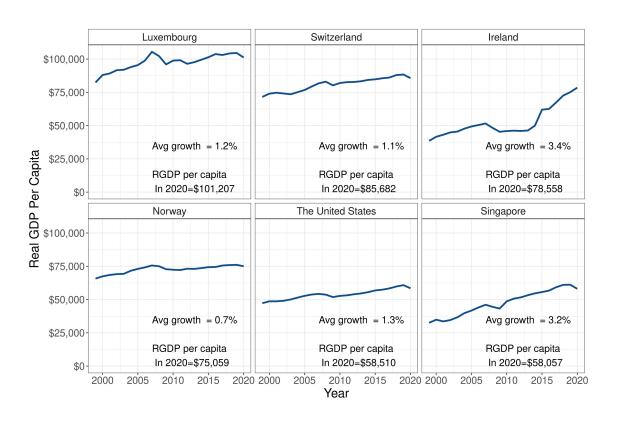

Long-Term Real GDP Growth

- Before the great depression, average growth rate was 1.4%
- After the great depression, average growth rate was 2.1%
- Real GDP per person in 1900 was approximately \$6,000 (using base year 2009)
- Real GDP per person in 2013 was approximately \$49,800 (base year 2009)
- Can you compute what GDP would be in 2013 if the average growth rate was always 1.4%?
 - Answer: $\$6,000(1+0.014)^{113} = \$28,869.56$.
- What if the average growth rate was always 2.1%?
 - Answer: $\$6,000(1+0.021)^{113} = \$62,814.53$.
- Small differences in growth adds up to a lot!

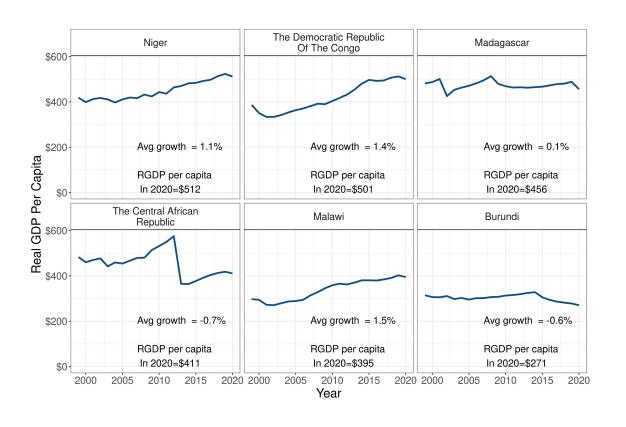

Economic Growth Facts Across Countries

- Before the industrial revolution, standards of living were similar across much of the world.
- Differences in per-capita income across countries have grown significantly since the industrial revolution.
- Rich countries today are similar in terms of per-capita income growth.
- Lesser-developed countries today are less alike in terms of per-capita income growth.

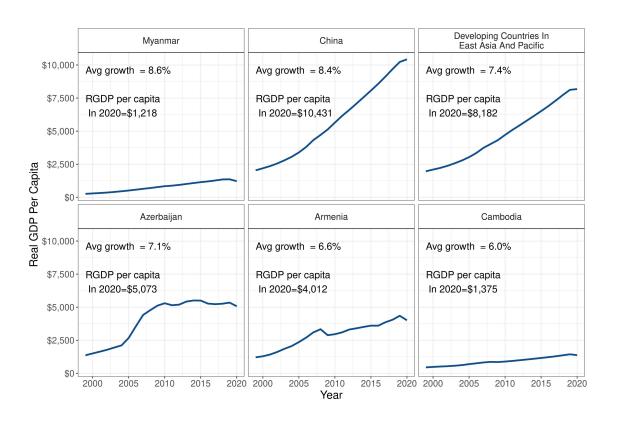

Richest Economies (Real GDP Per Capita in 2020)

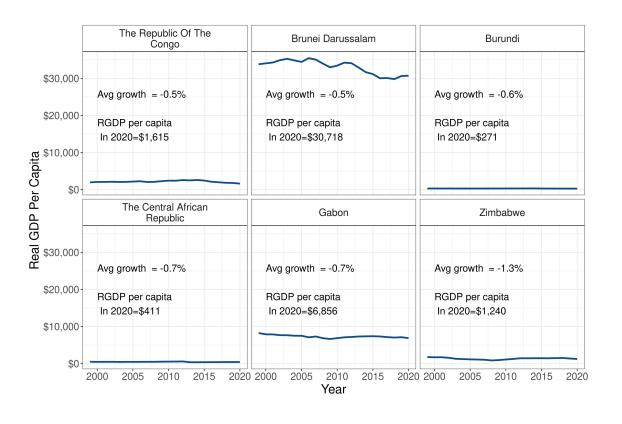

Poorest Economies (Real GDP Per Capita in 2020)

Fastest Growing Economies (1999-2019)

Slowest Growing Economies (1999-2019)

Growth Factors and Incentives

Saving and investment in new capital

- Savings is important for a sufficient equilibrium level of investment.
- What happens if savings supply increases?
- ↑ equilibrium investment → ↑ capital stock
- ↑ capital stock → ↑ production, → ↑ marginal product of labor

Prerequisites

- Markets for buyers and sellers to meet
- Property rights and protection
- Effective monetary exchange

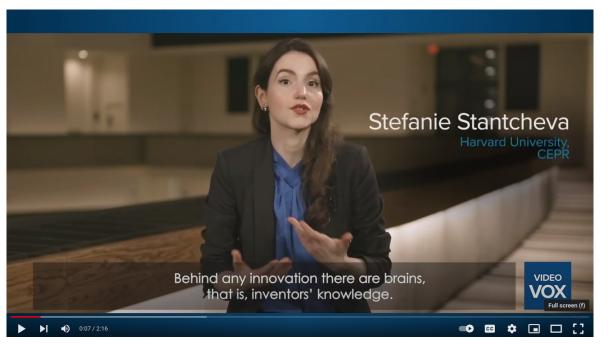

Investment in Human Capital

- **Human capital:** knowledge and skills of workers that can be used in the production of goods and services
- Improved education increases the marginal product of labor
- Human capital may not exhibit diminishing returns
 - Knowledge accumulation is **non-rivalrous**. One person learning something doesn't diminish or prevent another person from learning something.
 - Knowledgeable workers can have positive externalities. Not only is a knowledgeable worker more productive, other co-workers may benefit and be more productive
 - Acquiring and sharing knowledge gets easier as it grows. Example: Calculus, and you're no Isaac Newton.

Scholar Spotlight: Stefanie Stantcheva

Dancing with the Stars: Innovation through Interactions NBER Working Paper, March 2025.

Knowledgeable workers makes it easier for peers and co-workers to acquire knowledge.

Watch on YouTube

Discovery of new technologies

- Research and development leads to new technologies, more production possibilities
- Technological progress drives economic growth in the long run.
- There needs to be incentives to do research and development.
 - Patents on new products
 - Fund research and development through grants and state universities

Labor Productivity Curve

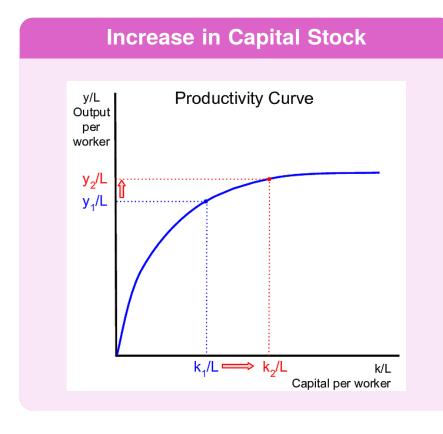

- Labor productivity curve: long-run economic growth model that illustrates how much output per person a country can enjoy with given levels of capital per person.
- Labor productivity is real GDP per hour of labor.

Labor productivity
$$=$$
 $\frac{\text{Real GDP}}{\text{Aggregate labor hours}}$

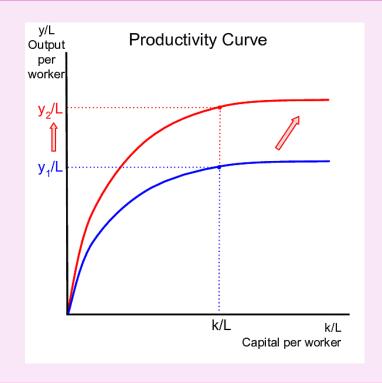

Labor Productivity Curve

- Think of labor productivity curve as a production function, in per-capita terms.
- Real GDP per unit of labor increases as you increase the amount of capital.
- But at a decreasing rate. Due to diminishing marginal product of capital.

How Labor Productivity Grows

Anything Else Improving Productivity

Labor productivity curve

- For given levels of capital stock per worker, curve shows output per worker.
- Increases in capital correspond to movements along the curve.
- Increases in technology or human capital shift the curve.

Catch-Up Theory

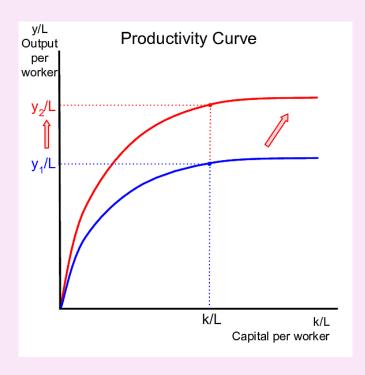

- Diminishing returns explains catch-up theory.
 - Lesser-developed countries have low levels of capital → high return to investing in new capital
 - Developed countries (like the U.S.) have high levels of capital → low return to investing in new capital
- Not all countries catch up: preconditions may not be met
 - Poorly developed goods and services markets, financial markets
 - Corruption, violence, war can threaten property rights
 - Hyperinflation

Improvement In Human Capital

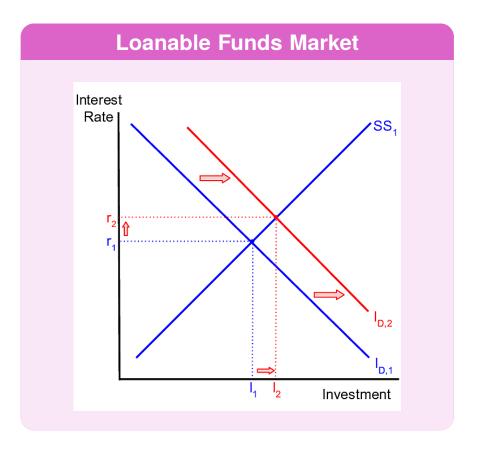

Mechanism

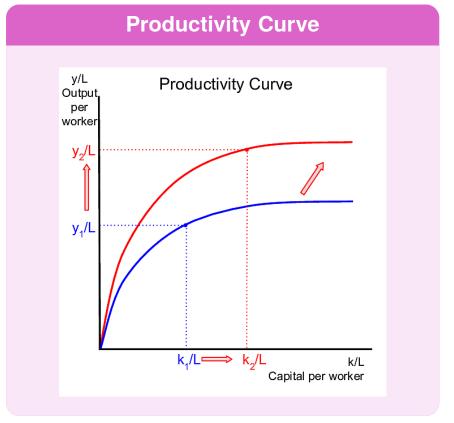

- Human capital is defined as the knowledge and skills workers use in production of goods and services
- Improvements in human capital lead to higher productivity
- Higher productivity shifts out the productivity curve
- Even without increases in capital stock, results in higher long-run output per worker

Graphical Demonstration

Improvement In Technology

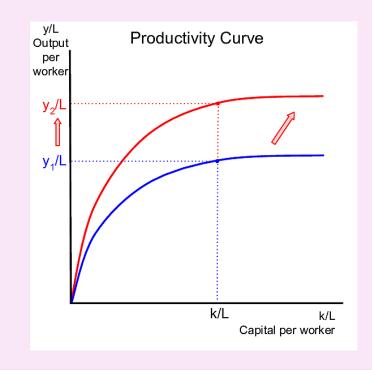

Improvement In Public Health

Mechanism

- Public health: policies and behaviors that lead to better health outcomes for entire populations, including actions that promote healthy lifestyles, adequate nutrition, disease prevention
- Healthier workers have fewer sick days and are more productive
- Higher productivity shifts out the productivity curve
- Even without increases in capital stock, results in higher long-run output per worker

Graphical Demonstration

Scholar Spotlight: Nabamita Dutta and Haley Maus

Share of Women in Parliament & Health & Educational Outcomes, Journal of Economic Development, 2021

Better Health and Human Capital

- Data: 70+ countries from 1974-2003
- Health outcomes children under 5 yrs, HIV/AIDS treatment, vaccination rates
- Post-high school education rates
- Controls for real GDP per capita, urbanization, financial development, etc.
- Result: More female representation in parliament leads to better health and education outcomes for men and women

About the Scholars

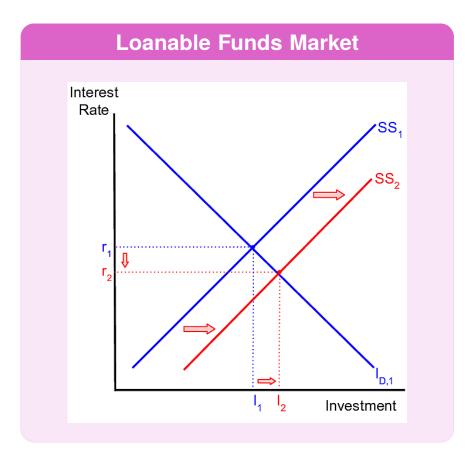

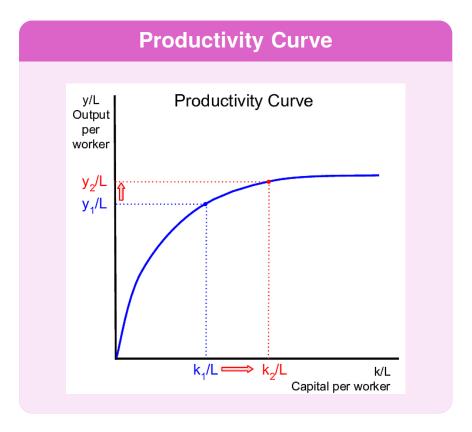

Left: Dr. Nabamita Dutta, Professor Department of Economics University of Wisconsin-La Crosse

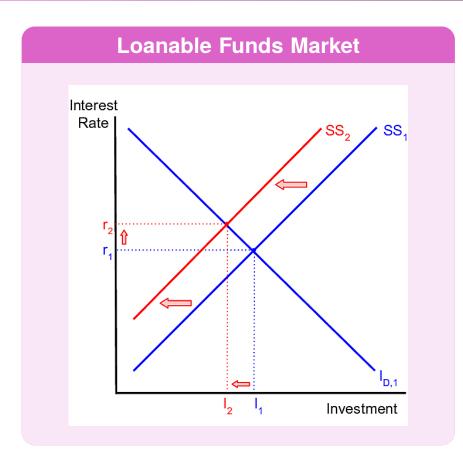

Right: Haley Maus Former student and graduate University of Wisconsin-La Crosse

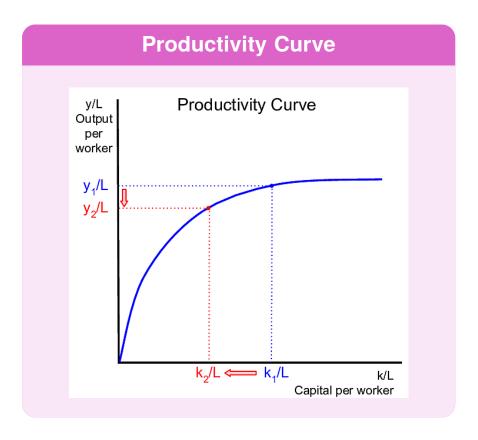

Increase in Private Savings

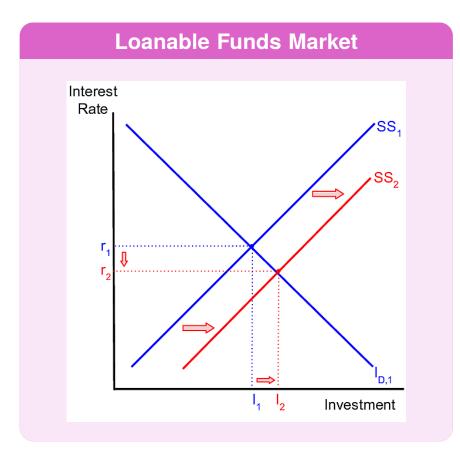

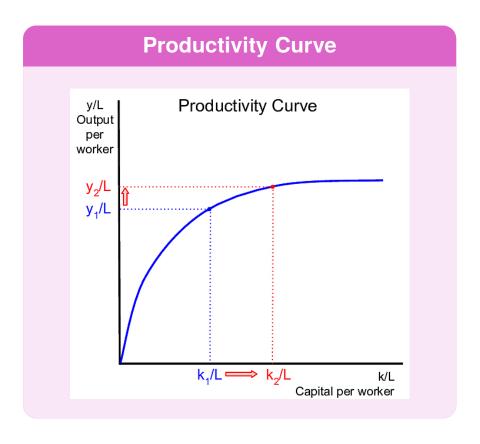

Increase in Government Budget Deficits

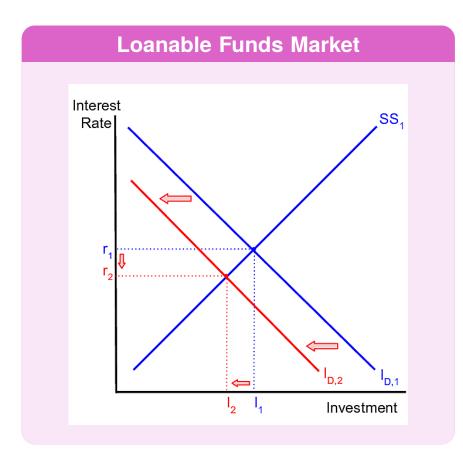

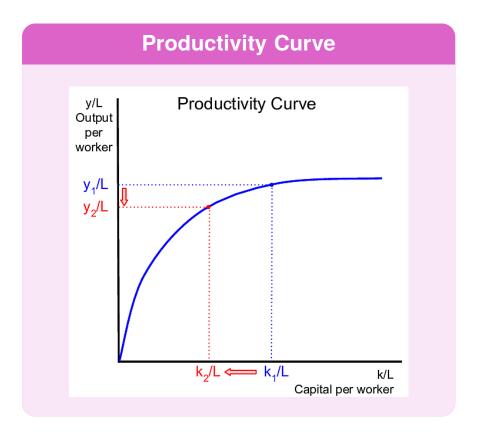

Increase in Trade Deficits

Improvement in Business Economic Outlook

Government Policies Encourage Economic Growth

Improve Human Capital

- Improve the quality of education
- Encourage higher educational attainment
- Encourage/subsidize education and training

Improve Public Health

- Public investment in meeting nutritional needs
- Access and affordability of preventative healthcare

More Government Policies Encourage Economic Growth

Stimulate Investment and Savings

- Global companies create operations in new countries, invest in capital
- Tax incentives for retirement accounts
- Sales taxes reduce consumption / increase saving

Stimulate research and development

- R & D is inherently risky Protect return on R & D with patents
- Encourage R&D with subsidies and research grants

Reading and Exercises

- Chapter 10 pp. 246-248: Differences in international growth rates
- Chapter 10 pp. 257-262: Productivity curve model
- Chapter 10 pp. 263-265: Government policies that can promote economic growth
- Canvas Quiz due Wednesday 11:59 PM.
 Multiple-choice, 15 questions, unlimited attempts allowed, only best score counts
- Homework/In-class Exercise due Friday 11:59 PM. We will work together in class on Thursday.
